

Feeling for this assignment

For this assignment, I built a to-do-list app for the final submission, although the application just fulfils the basic requirement of the final submission.

In that app, I built the categories and login signup, sign-out, and use the database to store the data.

As this is the first time that I learn how to build some web-app with ruby on rails, it is hard for me initially. Even till now, i cannot fully understand all the codings inside the rails app i built. It seems like I just rush to the field of rails but far away from become proficient with rails and ruby. That is quite a new field for me and I think i need some time to learn more and deeper about them.

For the learning journey of the ruby on rails, i read some book about ruby, and read the series of the books about "learn enough to be dangerous" for git, command line, text editor. Moreover, i follow the book Rubyonrails tutorial to build the app and try to understand the magic and power of rails. Also, some tutorial videos on the youtube gave me help for building rails apps.

I build the sample app, which is followed the steps in the ruby on rails tutorial, which i deploy on the Heroku with the web: <https://lancelot-sample-app.herokuapp.com/>

For the final submission, as i want to try that myself, and out of some reasons, i use another linux computer with made me to use a lower version of ruby and rails, (ruby 2.3.3 and rails 4.2.1). For that app, I tried but still found difficulty deploying that app to the Heroku, so I upload the sqlite3 data base to the Github.
